Sexual desire is a multifactorial phenomenon and should be approached from a multidisciplinary perspective. As a biological event, desire is the product of complex interactions between the individual, the partner, and the cultural context. A model of sexual desire is developed to illustrate some of the multifactorial causes of sexual desire and the meaning of sexual desire to the individual. The model is used as a framework to describe the factors that affect sexual desire, to illustrate multidisciplinary concepts, and to identify sexual desire as a concept that is dynamic and is influenced by both biological and social variables.Voltage-gated calcium and sodium channels are modulated by pore-forming peptides and small-conductance (KCa) channels, which are membrane-bound Ca2+-release activated channels (CRAC) that serve as signal transducers. In lymphocytes CRAC channels are important modulators of calcium signaling that controls several important aspects of immune response such as gene transcription and granule exocytosis. Recent studies of macrophages have shown that CRAC channels also have key roles in phagocytosis, antigen presentation, and autophagy. The research described in this proposal is centered on understanding the molecular structure and function of KCa channels and CRAC channels. We have cloned the genes that encode KCa channels and CRAC channels from bovine T cells. These genes have significant homology to the genes for KCa channels and CRAC channels from other organisms. We have already identified proteins that co-immunoprecipitate with KCa channel proteins and have determined that they form a complex in the endoplasmic reticulum. In this study, we will further characterize the structure of the channel proteins by identifying their subcellular distribution in cells and using in vitro transcription/translation to synthesize the channel proteins. We will construct a library of mutants of the channel genes and then use RT-PCR to screen the mutants to identify the regions of the channel protein that are important for subcellular targeting. This allows access to most keyboard macro keys on MSDOS and Windows 9x/ME. Install: You can install it to the default DOS and Windows 9x/ME 64kb COM port device list. Run: Run from a DOS or Windows console. For Linux or BSD OS: To run on Linux and BSD operating systems: In Linux and BSD operating systems, you can run the GUI by typing (in a console) xterm -e JoystickCursorTool For OS/2, Runix, or UnixWare: If you have installed JoystickCursorTool in the default COM device list, it is a Windows executable; thus you can double-click the icon to run it in the console. Otherwise, if you have installed it to a device other than the default list, you must run it

from a DOS or Windows console. Usage: JoystickCursorTool simulates the keyboard keys using a joystick. It can be used for keyboardless navigation in browsers and file managers, playing games without native joystick support, using the joystick port for electronic interfaces without needing to write a joystick driver as well as other situations where only a small subset of the keyboard is typically used. You use the joystick in the following way: Start JoystickCursorTool and plug in your joystick and hold down the Start button. With the joystick in its normal position, use it to control the cursor. Any movement of the joystick to the right (or left) will move the cursor to the right (or left). A joystick movement to the top (or bottom) will result in a return to the top (or bottom) of the screen. In the middle of the screen, buttons can be used to move the cursor to certain buttons or to specify a pixel size. The left and right buttons can also be used to increase or decrease the button size. Any movement of the joystick to the center will result in a reset of the joystick. The middle buttons (3) simulate the keyboard keys in the following ways: Enter: - Arrow keys: - 1: Press 1 to print (or press 1 twice to exit) the current page. 2: Print the current window. 3: Clear the screen. 4: Print current line. 5: Exit. Home: - Enter: - Arrow keys: - Left: - Arrow keys: - Right: - Arrow keys:
