On the eve of the historic weekend when the US Senate will take up the 21st Century Cures Act, the Senate Health Committee held an oversight hearing at which committee members posed the question: Who is going to control our new drug pricing laws? Watch that two-minute video here, where committee members talk about the issues:

Here's the big picture, from the Committee on Health, Education, Labor, and Pensions summary of the hearing: The bill ... [has] two policy aspects: one is to promote transparency in Medicare and Medicaid cost-sharing; and the second is to provide for cheaper medications for Medicaid patients. These two are identical approaches to addressing two difficult problems: This report summarizes the various provisions and provisions of the bill and what they will mean in practice. H.R. 1606 can be summarized as follows: 1. Strengthening Medicare/Medicaid Fraud Criminal and Civil Penalties 2. Strengthening Medicare/Medicaid Transparency 3. Changing the Medicare/Medicaid Prescription Drug (Part B) Coverage 4. Making Medication Savings Program (MSRP) Available to Everyone 5. Giving States New Options for Pharmacy Price Transparency 6. Exempting Specialty Drugs from Cost Sharing 7. Prescription Drug Coverage for Children with Autism When a bill is this sweeping, there are bound to be some details that get overlooked in the rush.

Here's one: Did you know ... that one of the legislative achievements of the Committee's Medicare Modernization Act of 2003 was the creation of the Medicaid Advancing Pharmacy Access (MAPA

Prepare your mind to invest in his film, even if you may just want to pause it and read through a few of his recent productions. Field of the Invention Embodiments relate to a semiconductor device and, more particularly, to an input semiconductor device. Description of the Related Art With the trend toward highly-integrated semiconductor devices, the length of metal lines to be formed in a semiconductor device is decreasing. As the length of the metal lines decreases, the capacitance between the metal lines increases. When the capacitance between the metal lines is increased, the characteristic or performance of the semiconductor device may deteriorate. As a result, resistive memory devices have been recently developed to reduce the capacitance between the metal lines, instead of using a non-volatile memory device, such as a flash memory device. Resistive memory devices are implemented to satisfy a need for a non-volatile memory device which is electrically programmable and erasable in a large capacity. Examples of the resistive memory devices include a Magnetic Random Access Memory (MRAM), a Phase-Change Random Access Memory (PRAM), a Resistive RAM (ReRAM), a Ferroelectric RAM (FRAM), and the like. These memory devices have a structure in which two electrodes (e.g., a first electrode and a edd6d56e20
