PYTHA can create 2D working drawings without the need for the designer to export the file to AutoCAD. Once the 3D model is completed, PYTHA can create .dxf and .xml files for export to graphics editors such as Adobe Illustrator, Adobe Acrobat, and PDF Print Screen. The board provides for the use of a PCI interface, and can also be used to connect printers such as LXC-Plus. The portable version of PYCHA PU-1 is adapted to work with laptops and netbooks, allowing you to use USB drivers to quickly connect the device. The compact version contains only a USB interface and comes with a software package that contains the board itself, the PYPHA software, drivers, a diagnostic program (and applications associated with this program), and a CD with drivers and a diagnostic utility. The PYFET has two electrodes, one of which is used for switching the power output and the other for the power supply. The melting electrolyte is formed inductively. To use the pinout function, two contact pads are used on the connecting blocks of the control panel, located in the aft part of the board. In addition, two platforms are used, located on the connecting block of the remote control. Each electrode has two jumpers strung on it. The PowerPoint control system is easy to use and does not require any drivers to be installed. It is possible to use a wireless communication network, or an RTC network with one PC and one printer.
