The first computerized drafting programs were similar to manual drafting programs in concept. Computer programs typically consisted of a set of commands that were issued in order to draw basic geometric shapes. As the drawing progressed, the CAD operator was required to perform some form of editing, such as rotating, moving, or resizing, to conform the final draft to a given project. However, the actual drafting work was done on paper. The paper draft was then scanned and the computer resized, rotated, etc. to create a complete CAD model. An early view of the beginnings of AutoCAD. AutoCAD was designed from the beginning to eliminate the need to create paper drawings. The CAD operator types in a command that is understood by the software. Rather than having to interpret a sequence of actions, the software sends the command to the computer, which immediately executes the command. AutoCAD then quickly recalculates all of the objects that are affected by the new command. In addition, the CAD operator doesn't have to worry about any other drafting actions, as they are automatically done for them by the software. What is AutoCAD? As the name implies, AutoCAD is designed to provide automatic drafting functionality. To be able to do this, the program must track the changes to objects over time. To do this, all objects in the drawing are constantly being tracked for change. At any given time, there are two types of objects tracked: Live Objects – Objects that have a selected or active tool. The drawing interface can not be changed for live objects. – Objects that have a selected or active tool. The drawing interface can not be changed for live objects. Model Objects – Objects that have not been selected or active. The drawing interface can be changed for model objects, but only the selection box can be adjusted. The AutoCAD drawing interface contains these elements: The Annotation Toolbox – This element is used to show and hide text and/or line annotations. – This element is used to show and hide text and/or line annotations. Annotative Drawing Elements – These are permanent annotations that cannot be removed or modified. They are used to show dimensions, notes, tool tips, etc. – These are permanent annotations that cannot be removed or modified. Autocad provides two menu options, "File" and "View". In "File" menu, right click on "File..." and select "New". Then choose "AcDb file (*.dwg;*.dxf;*.dwg)", click on "Next" and enter a name for the "document" you want to open. In "View" menu, choose "View" and select "General Properties" and "AcDbText". For "Text" choose "Object" and make sure that "Key" is selected. Then click on "Save". Next, you need to select the text in the "Object" property by clicking on the Text property in the "General Properties" window, and then choose "Vertex". Select all vertices in the document (highlight all vertices with the mouse). Then, right click on the vertices and choose "Merge". Next, close "View" menu, and go to "File" menu and choose "Close". Right click on the new merged vertices again and choose "Generate". Then choose "Save" and type "obj.dwg" to save it as an "ACDB" file. Note that all the elements of an AutoCAD (or AutoCAD LT) file should be in one layer. If you try to create a file with multiple layers, you will get a warning: Open file warning for layer X that is not open and AutoCAD is unable to create a layer that has multiple items in it.
