Once metastatic melanoma has developed resistance to B R A M-ME or less intensive therapies, chemotherapy is employed and typically these patients are considered to have incurable disease. Until recent years, the patient with advanced melanoma has had limited therapy and had an extremely poor prognosis. Treatment of patients with advanced melanoma has been predominantly palliative with dacarbazine; the combination of dacarbazine and interferon showed only a modest survival benefit when compared with dacarbazine alone. Recent studies with vaccines and adoptive cellular therapy have demonstrated improved efficacy when these approaches are used in combination with standard of care therapies. However, all of the currently approved therapies for advanced melanoma induce an improved response rate and prolong overall survival, but ultimately result in minimal overall survival benefits. Thus, the development of combination immunotherapy with immune checkpoint blockade was the logical step in improving clinical response and overall survival. The increased efficacy of ipilimumab demonstrated in the phase III trial Immune-Checkpoint inhibitor in Patients With Metastatic Melanoma (NCT00620804) which enrolled 423 treatment-naive patients with metastatic melanoma was accomplished with a novel targeted drug (ipilimumab). However, ipilimumab alone is expensive and does not provide a cure for advanced melanoma. The clinical benefits of ipilimumab have been demonstrated as an add-on therapy and have been confirmed as a well tolerated therapy in patients with advanced melanoma in phase III trials. Furthermore, another immunotherapeutic agent, nivolumab, has also been approved for use in the treatment of advanced melanoma as monotherapy in phase III trials. In view of the limited efficacy of current treatments and the high toxicity profile of immunotherapeutic drugs, more specific targeting of tumor cells is needed for more effective treatment of melanoma. Melanoma is a malignant neoplasm that originates from melanocytes. Clinically, melanoma is a fast growing cancer with high metastatic potential. Melanoma can spread locally, or may spread to distant

Wanted to add a shot of my favorite program - PE Explorer (yet). This is a PE file viewer with some nice features and since the plugin system is very limited I thought it would be interesting to share it: PE Explorer Plugin system allows to add the following features to PE Explorer: - Detect specific PE sections of interests (code, data, bss, heaps, etc.) - Perform a PE file edit operation on a loaded file, regardless of where the PE file was loaded to from - Perform PE file edit operation and save the result in the currently loaded file - Note: PE Explorer will ask for loading the plugin when the PE file is opened and loaded - Note: The plugin will be loaded only once, so if you want the functionality to be available on the other PE files you have to load it again. If you read my last post you would already know I'm trying to create a package that can check EXE files for potential viruses. Version 2.0 of the PE Explorer Plugin has been released: - now uses native Win32 API functions, avoiding DLLs and useless calls for things like GetProcessPathA - accesses the PE file directly instead of a temporary copy - runs only in the current folder, which is the one you can click OpenFile dialog from - allows to load plugins (i.e. PE Explorer plugins) - has the OpenFile dialog now - supports saving the files in the PE Explorer as a proper archive - I made a quick and dirty video demonstrating how the plugin works: I'll try to create a tool that can check EXE files for viruses, which should be ready soon. In the meantime, I'm continuing to expand the feature-set of the plugin. Hope you enjoy it :-) Last week I wrote about an updated version of PE Explorer (www.peexplorer.net) with the ability to check EXE files for potential viruses. This version includes a new plugin system with very useful abilities for checking file integrity, including the possible (though not mandatory) addition of custom algorithms for improving virus detection. Here is a quick video demonstrating PE Explorer's plugin system: b7e8fdf5c8

## What's New in the DllChecker?

DllChecker is a new open source tool, which enables you to check DLL files on your hard disk for compatibility problems. DllChecker is developed in Perl, with a simple and user-friendly GUI and no installation required, just copy the executable file into a preferred directory and execute DllChecker in order to scan DLL and EXE files. DllChecker analyzes files and generates a report in the form of a plain text or HTML table. DllChecker Analysis Size: Your DLL file size is specified when you create the report; it is not limited. The size of the report depends on the DLL file itself. Additional DllChecker Screenshots: DllChecker main window DllChecker homepage You don't need to install the program, only copy the executable file (version 1.0) in a folder on your hard disk. When you start the program, you don't need to enter any settings or configuration. The tool will automatically analyze your DLL files and generate a report. You can select between plain text and HTML table log (HTML table reports are more user-friendly). The report will appear in the folder you selected in the start dialog. The report is an XHTML file, so if you open it, you will be redirected to a page where you can see the report. If you have an installation of Perl installed on your PC, you can save the file as a web page. If you use HTTP server software, you can save the report locally. To do this, you need to copy the report folder to the root directory of your server ( DllChecker report example This tool works with Windows XP, Vista, Windows 7, Windows 8 and Windows 10.
