The NRA's director of federal affairs, Andrew Arulanandam, told Business Insider that it won't be asking for more gun restrictions as part of its campaign. Instead, he said, the group is planning to push for new restrictions on gun shows and in the media. Arulanandam said the group is going to run ads targeting this "dangerous group of people" in the weeks leading up to the November election. The gun-rights group, which may see its strategy thwarted this fall due to increasing

CodeCompileUnit, CodeFile and CodeModule objects readonly? For example, if I want to store a value from CodeModule into the database, can I change the compiled value of a variable in the project? A: Nope, they are readonly. A little more about them here. The DCC compiler actually refers to them as being by convention, so it's left to the programmer to get the compiler to compile the code as they see fit. The access control is enforced by the compiler, not the runtime (unless you use the CustomBuild option in your build settings, as I have some code that does this). So, don't change the value of these objects. If you want to store the state of the object for later use, instead create new instances of them. To make a new instance of a CodeCompileUnit, for example, use the CreateCompileUnit method. You'll need to get the source from the compiler and create a new, new instance of it. So, again, don't change the values of the objects, but create new instances. I'm working with Delphi 6 and have this question: Are the CodeCompileUnit, CodeFile and CodeModule objects readonly? Not with the D6 compiler. Can I change the compiled value of a variable in the project? Yes, you can create a completely new instance of a code unit, and change its values. This may be what you want to do. If you really want to change the compiled value of a variable, you can do that too. But, you'll have to do that yourself.
