I'm trying to fit the matrix of this shape in the rectangle of a matrix. I've tried many ways to fit the pieces in the rectangle using a hard limit of dimensions. But for some reasons I can't get it to fit. What could be the problem?

Unfortunately, that doesn't seem to be the case. The emergence of such a powerful phone has meant I can play games on it, watch movies, make phone calls - even the awful one, in my case - but to change anything on my phone - save for a few apps that are already there - I need to get the old 4s back. It seems natural to try and use the 3G connection to tether the phone to my desktop when I'm at home, but the temptation of me having access to the internet and its power is simply too great. I find myself hovering my hand over the button, thinking, but probably not enough to do it. So once again I'm left pondering the change from Symbian to Apple's iOS. I am frustrated by the lack of open source software and I find the lack of openness of third party developers disgusting. I want more choice. I want features I can't find. I want the option to change. I want an app for my calender, for example. I want something that I didn't have to get through third party sources. I don't want to add the 30% VAT to apps I want to buy. I don't want

money to be the only option I have. I want to be able to pay for what I want, when I want. If I've paid for an app, I shouldn't have to put up with a paywall, or being forced to copy

Sociable Software Sociable Software, based in Preston, England, UK, was a publisher of web conferencing and videoconferencing software. It was sold to its competitor Sage Group in November 2006. Sociable Software was founded in 1997 as Soca in 1997. The founders included Andy Smyth, Simon Graham, Peter Hall, Gordan Karapinić, Mike Stone and Kevin Pitman. Shortly before the sale to Sage, sociable software had released sociable media, a proprietary web conferencing and screen-sharing platform that was subsequently acquired by Soho@Home. I am working on the coordinate-free formalism of field theory and trying to understand how higher-order curvature terms enter in. In textbooks like this one, if you integrate something like $\int dx^4 \sqrt{g} R^{\mu \kappa \lambda}$ you get a result because it is a total divergence and you simply take the coefficient of dx^4 out, and calling the resulting surface term $\int dx^4 \sqrt{g} T^{\mu \kappa \lambda} R_{\mu \kappa \lambda}$ (where $T^{\mu \kappa \lambda}$ is the energy-momentum tensor) the action evaluated at the boundary of the manifold is $S[\Phi] = \int \mathrm{d}^4 x \left(\sqrt{g} T^{\mu \kappa \lambda} R_{\mu \kappa \lambda} - \dots \right)$ But why? Just because it's a total divergence, it's a boundary term and the result is unaffected by this change? Well, if you change your coordinates to $X^\mu = (x^\mu, \dots)$
