Fourier transform infrared microspectroscopy of histone core particles and nucleosome core particles. Fourier transform infrared spectroscopy of histone core particles and nucleosome core particles isolated from calf thymus has revealed the composition of their non-proteohelically folded DNA. The ratio of the helically unwound DNA to the beta-sheet DNA in these particles was determined by difference spectrum analysis. The ratio of non-proteohelically folded DNA to the beta-sheet DNA in histone core particles was found to be approximately 0.85, whereas the ratio in nucleosome core particles is approximately 0.40. An analysis of the samples, prepared from dried hydrated particles, has also shown that the asymmetric units of the cores are substantially identical to those of the histone octamers.

Q: What is the reason for different ways of calling functions in Python? I don't understand exactly why and how one way of calling functions is always the other (without enclosing the function's name in double-quotes). Example: >>> a = 3 >>> def foo(): print a >>> def bar(): print a >>> foo >>> bar >>> bar() >>> a = a + 4 >>> bar() Traceback (most recent call last): File "", line 1, in NameError: name 'a' is not defined Why does bar() work differently? Shouldn't it use a instead of a since it's defined before bar() is called? My guess is that foo() uses scope, and since bar() only sees the global scope it uses a. But I'm not quite sure of that guess. A: The real answer is that Python uses an "execution context". The first line defines foo and makes it "local" to the function it's in, so any references to "a" inside foo refer to the local variable a (and in this case, 3). The second line defines the variable "a" as a global scope item, which is visible inside of bar and all of its local scopes (so, inside bar and its local scopes, "a" will refer to 3). The third line is running bar, which again is in a local scope, so "a" (which is still 3) is available inside of it. //! moment.js locale configuration ;(function (global, factory) { typeof exports === 'object' && typeof module !== 'undefined' && typeof require === 'function'? factory(require('..moment')) : typeof define === 'function' && define.amd? define(['../moment'], factory) : factory(global.moment) }(this, (function (moment) { 'use strict';
