I want to access the console (or logs, etc) from the container, so that I can perform some actions and update my dockerfile and reapply it to the container, rather than having to spin up a new container for the updated changes. A: You can use docker logs command to see the logs of your container: docker logs -f From the help message: -f, --follow Follow log messages stream until completed In your case, you can type: docker logs -f [container_name] For example, I am using it for a web service, and there is a specific log file that I want to see, so I use the option -f to see the logs that have occurred while the container is executing. So, in your case, you can use docker logs -f [container_name] to see the log of your container. In conventional processes for producing high purity silica, especially for use in epitaxial growth of semiconductor devices, the crude silicon material from a float-zone furnace, often referred to as beta silicon, is placed in a reaction vessel, or reaction tube, wherein the beta silicon is reacted with a fluorine-bearing gas, commonly referred to as a dopant gas, to produce a purified solid reaction product referred to as a silica product. Typically, the reaction of the beta silicon with the dopant gas is a batch process. The reaction has a tendency to raise the temperature of the vessel, and to contaminate the gas purifying equipment with undesired impurities. One of the conventional processes for producing high purity silica is known as the Liza process, as described in U.S. Pat. No. 3,692,480. That process is conducted at a temperature of about 1500.degree. C. to 1600.degree. C. and a pressure of about 5 atmospheres absolute. The process uses a hydrolyzable metal silicon of the formula $M(Si)_2H_6$, wherein M is an alkali or alkaline earth metal. Typically, the crude silicon is in the form of a molten mass of beta silicon which is placed in a sealed reaction tube and contacted with a dopant gas, such as silicon tetrachloride, at a temperature of at least about 1150.degree. C. The

Notes: Because you have an empty line before the row you do not have a paragraph so you do not get an opening paragraph. With just a few minor changes, you can also do something like: `grep -Po '^.{1,5}\s-\s\S{1,}'` The `^` matches the beginning of the line. Matches for start of line. This is needed because `-` is used to indicate a literal `-` but with `^` it needs to be escaped to indicate that it doesn't get interpreted. `.` matches any character. `\s` matches any whitespace (tab, newline, spaces, or carriage return). `-` matches a literal `-`, which is what we're looking for. `\S` matches anything that is not a whitespace. `{1,5}` matches between 1 and 5 characters. `\s` matches any whitespace (tab, newline, spaces, or carriage return) and `-` matches a literal `-`, so you get the whole line. After the closing brace we can omit a `-` (which would match the line before the first `-`). `^` matches the beginning of the line. Note: `-e` would specify not to just match " lines but also to ignore those. i.e. the empty line between the header and the first data row. `-o` would only match lines that have an empty line. The other solution Since there are no more lines after the end of the header you can also say: `$ cat file | grep --ignore-case '^[^|]*.*$' lawdictionaryenglishtobanglapdfdownload.`
`lawdictionaryenglishtobanglapdfdownload` Â· Aaf Recovery Tool 4.6 20 If you only care to match the very last line then you could also use: `$ cat file | grep -oE '^(^|)[^|]*.*$'`
`lawdictionaryenglishtobanglapdfdownload` Note: `-E` means "use extended regular expressions".
`^(^|)` means "the whole line is matched if there's a `-` or any character on the line (`^`), then we could also look `-` after the `-` to match the line after the last non `-`". Example: See the official tutorial. `$ grep 6d1f23a050`
