I am using.The present invention relates to saw blades, and more particularly to an improved saw blade for cutting stone concrete, soil, asphalt, tile, brick, and the like. There are many applications where a blade with teeth shaped to be effective for cutting concrete and stone is desired. An example is a hand held power tool such as a power hammer that may be fitted with a concrete cutting blade to be used for cutting small diameter concrete pipes, such as discharge lines for single family residences. The invention is especially advantageous in rotary hand saws and is applicable to reciprocating saws. Conventional concrete saws typically have a diamond blade formed with a central hole and a pair of tungsten carbide rasps extending from opposite sides of the central hole. The rasps extend in the cutting direction for at least a portion of their lengths, and each tooth is typically spaced apart from the adjacent rasp tooth. Conventional saws of this general type are illustrated in U.S. Pat. Nos. 4,309,823; 4,687,213; and 4,898,000. In saws of this general type, the saw blade is clamped in a saw tooth c6a93da74d
