## Auto Xs Battery And Alternator Tester Instructions

as noted above, our battery tester will load a specified load for a specified time. to achieve a programmed load, the tester can be programmed to simulate a wide range of current loads from a vehicle, or any other battery related electrical load that may be placed on a battery. the xs power tester simulates the load of a vehicle amplifier (as well as the loads of all the other components in a vehicle. it is possible to run the load for 30 or 60 minutes, and measure the battery amps using the tester. an amp load test of a 30 minute duration is recommended for testing most batteries, as it will give a good idea of how well a battery will perform over a period of time. for the best results in an amp load test, the battery should be cycled at least 10 times, with a 10% load, as most battery manufacturers recommend, before an amp load test is run. the tester will also load and measure the battery voltage for a specified time. to achieve a programmed voltage, the tester can be programmed to simulate a wide range of battery voltages. for example, the tester can be programmed to load at a 20v, and be measured at 0v, then be programmed to load at a 20v and be measured at 10v, then be programmed to load at a 20v and be measured at 15v. this allows the tester to simulate every condition within the battery range and provide the users with a detailed battery report. to stop the load, the tester will automatically discharge the battery for a specified amount of time. this will be done using the same load test method used to load the battery (either the vehicle amp load test, or the amp load test of 30 minutes duration). this will provide a real-time battery discharge report.

## Auto Xs Battery And Alternator Tester Instructions

to measure the battery capacity, the tester can be programmed to load and measure the battery until it has reached the desired capacity, and then automatically discharge the battery. this will provide a real-time battery capacity report. when a battery is being charged and discharged at the same time, it is possible that the battery will not be charged or discharged at the correct rate. to check this, the tester can be programmed to measure the voltage across the battery when it is charged and discharged at the same time. if there is a difference in voltage when the battery is being charged and discharged at the same time, it is possible that the battery has a fault and is not being charged or discharged at the correct rate. this can be determined by using the tester for 30 minutes, or until the battery reaches a specified capacity. the battery can be cycled at a specified rate, and the voltage across the battery can be measured. the tester can also be programmed to measure the amps across the battery when being cycled at a specified rate. the tester can then be programmed to load the battery at a specified load for a specified time, and the amps across the battery can be measured. this is a very useful test if the battery is being used in a vehicle. there are different tests that should be performed to test the maximum amp-hours output of the battery and alternator combination. using a multimeter, perform a short discharge cycle and check the battery voltage and then record the amperage. then perform a continuous discharge cycle and record the amps. 5ec8ef588b
