

however, the licensed structural engineer will be able to tell you what is causing the ceiling crack and give you a reliable quote for the repair work. they will also be able to tell you what is causing the ceiling to heave and give you a quote for correcting the problem. the licensed structural engineer is the person who is qualified to give you the most accurate quote. if the application of a tensile force is favorable, then the tensile strength, t_n , will be determined, and there will be no need to consider any cracking. if the application of a compressive force is favorable, then the compressive strength, c_n , of the masonry will be the limiting factor. if the application of a tensile force is unfavorable, then the section will crack with a net load of: in contrast, when the application of a compressive force is favorable, then a masonry section is considered to be cracked if it will fail at a net load of p_c . if the application of a tensile force is unfavorable, then the section will crack if the net load is: the method of cracking refers to the application of a limiting load or uniaxial stress. the evaluation of the cracking potential of a masonry wall is a function of the strength of the material. in concrete, the strength of the material is dictated by the type, the size, and the quality of the aggregate. in unreinforced masonry, the strength of the material is dictated by the quality and size of the masonry units. the strength of the material also depends on the strength of the bond between the masonry units, which is a function of the quality of the masonry units. if a load is applied, either in-plane or out-of-plane, to a masonry wall, the strength of the wall is the minimum of:
