-- Pngtastic is a library for PNG image optimization (read as "image shrinker") that has been designed for maximum performance and PNG image quality. It is an alternative to the popular GimpPng project, and can be used in any Java application that processes PNG images. As you can see from its name, it is the work of Alexander Schoepp of kover3d. Even though the project is Java oriented, it has been tested with other languages (Perl, PHP, etc.) and with other tools (GimpPng,...) Source: -- ---------------------------------- Difference with GimpPng: --- --- Pngtastic: - uses the Java ImageIO library - Java 1.6 & JDK 1.7 compatible - works in a web server environment - because the image quality is not calculated pixel by pixel, but block by block, there is no need to define a fixed 'block size' for image optimization - because the size of the final image is not calculated pixel by pixel, the images will keep the same quality - because there are no PIXELTRANSFORMations defined, the PNG can keep the original 'transparency' and its image quality is not reduced - the library can be used without a GUI and with any type of editor - it is very easy to integrate in Java applications - no unnecessary dialogs, it is a pure Java program - no 'browse image' dialogs, just drop and go - you can set the size of the final image with some options - because it is pure Java, it does not require an external IDE What is the difference between Zopfli and Snappy (GZIP)? Zopfli is an Apache Licensed software library that supports both pre-compressed and natively-compressed formats. It also supports the GNU zip format. A pre-compressed file is basically compressed using zlib (or a similar library), but it is also prepared so that it can be decoded faster than a normal compressed file. Snappy (GZIP) is an open-source software library that implements the gzip and xz compression formats. It has been developed by Google Inc. The main goal of the project is to create a small library that can compress data in a highly efficient manner. In fact,
