Q: RxJava2 with RxScala: specify extra parameters for Observable.zip With RxJava it's possible to use zip operator with extra parameters like this: Observable.zip(Observable.range(0, 3), Observable.range(4, 7), (int i, int j) -> i + j) .subscribe($i -> \{ // Do something with i and j \}$); I've implemented a similar method in RxScala, which works fine, but it seems to me that there should be a better way to specify the extra parameters of the zip operator, as if I try to add a 2-tuple as an argument it doesn't compile: Observable.zip(Observable.range(0, 3), Observable.range(4, 7), (i, j) -> i + j) .subscribe($i -> \{ // Do something with i and j \}$); It's possible to specify extra parameters in the observable method? I'd like to be able to write something like this instead: Observable.zip(

JPEG-XR Exporter Activation [April-2022]

KeyMacro is a simple software tool developed to aid in recording keyboard macros. It allows you to record a series of commands as a single program, and then replay the commands. You can save the macros to text files, and then load them into Photoshop or a similar program. How to use KeyMacro: 1. First, open KeyMacro, and set the desired export settings in the dialog box. 2. Next, create a new file in the location you want for the kmr files. 3. Click the Save menu, and then click Save a Macro. The macro is saved to a text file. 4. Next, click the Open menu, and then click Load a Macro. The macro is loaded into the text field. 5. Click the Play button, and then press the keyboard shortcut to record the macro. 6. Repeat the steps for as many macros as you need. 7. Once you have saved the macros in text files, you can open them in the text editor, and then paste the macros into the text field for your chosen program. KeyMacro is compatible with most operating systems. Features: Supports Win2K, XP, Vista, and Windows 7. Supports shortcuts to the most commonly used programs. Supports all major programs. Supports right-to-left languages such as Arabic and Hebrew. Supports double-byte languages. Supports text input boxes. Supports the following file formats: kmr, kmrx, and kmm. Supports the following image formats: JPG, JPGXR, PNG, PNG24, PNG32, and PNG48. Supports picture formats: BMP, GIF, PCX, PCT, PPM, and TIF. Supports the following image-editing tools: Photoshop, Photoshop Elements, and Adobe Photoshop Lightroom. Supports the following international languages: English, French, Spanish, German, Italian, Russian, Arabic, Hebrew, Chinese, and Korean. Includes a trial version of KeyMacro. Supports the following screen resolution: 1024x768, 1280x1024, and 1600x1200. Supports the following keyboard languages: English, French, Spanish, German, Russian, Arabic, Hebrew, Chinese, and Korean. convert your photos to JPEG XR (High Dynamic Range). JPEG XR is a high dynamic range image format which is a combination of JPEG and HDR (High Dynamic Range) - two coding formats which have already a lot in common. With the original format, all the image is coded in 8 bits, which is not sufficient to show such high dynamic range. With the JPEG XR format, all the image is coded in 10 bits and 32bits/channel. The final result is a 1:1 preservation of the original image. The format is not easy to understand but, as it is based on the JPEG-XR, your files will be identical to the original. One of the main features of this application is the choice between RAW and Non-RAW. Non-RAW files are coded without any compression, so they are the original data (24bits/channel). RAW files are coded at a given compression level and can be easily edited. Here are the main features of the non-RAW image processing: - RAW processing Non-RAW images can be processed without re-compression of the file, which allows you to correct colour mistakes without loss of quality. - Converting RAW to non-RAW When you select "Convert" in the RAW to Non-RAW list, the application will automatically calibrate and apply the right processing to your image. - Tones and Highlights The highlight and the low tones can be corrected thanks to a histogram which allows you to adjust the low and the high tones. It's even possible to create your own histogram. - Tones and Shadows The same as the previous feature, the histogram allows you to correct the high and the low tones. - LUT (Look Up Table) You can make a LUT for your conversion. The LUT will be applied to the entire image and will generate a change of shades. - Auto LUT and Auto Lighting You can apply a LUT to your image or let the application detect the lighting of the image. - Contrast and Colour Adjustment Contrast and Colour can be easily corrected thanks to sliders. - Save the LUT It is also possible to save the LUT or the processed image. - New Tone: a tone generated by the histogram, or a bright area This is a new feature in this version: the application will create a tone based on the histogram and a bright area for each image. - Dehaze and Lens Correction For some images, you might need to correct the dehaze and the lens correction. - Fill Light and Shadows You can adjust Fill Light and Shadows. This correction can be applied in order to create a pleasant
