New features in Photoshop include

- Adobe Sensei—a new feature powered by AI that enhances the accuracy and quality of selections. With all new in-app brush options, users can easily create and edit beautiful artwork more quickly and efficiently by using familiar shapes and blending behaviors that replicate an artist's strokes.
- Select from Live Saturation. In conjunction with the new hue channel support in Photoshop, this feature allows users to more easily manipulate their images by selecting text and an object with the blended hue channel.

- Click anywhere on a layer to edit all properties of the layer (in the properties window). Now, when editing values such as opacity, even outside the layer's bounds, users can quickly change the values simultaneously throughout the entire layer.
- Delete and Fill. Users can now quickly remove and replace objects in an image with a single action, similar to how they can easily overprint a selected area of a photo (using fill) or remove a selected area (using delete).
- Brush to Shape. Users can now easily adjust volumes and the size of a brush, paint in a live shape, and use a brush as a stencil to mask shapes, including paths.
- Warm Up to Adjust Tool Settings. Users can now warm up the appearance of a selection box and adjust the parameters of the selection tools (like blending, replacement, and feathering) on a per selection basis. This is most useful when you want to see and select differently based on the tool settings. Also, users can now quickly place multi-stroke selections.
- Color Match. Easily match and convert a color from or to a reference color, while maintaining the image's proportions and features. The new feature also lets users more easily match colors in mixed-color photos.
- Lens Correction. Lens Correction makes it easy to compare, adjust, and print output from different lenses. The result? Photos that look more flattering and accurate on any type of print site. Users can easily compare images and modify color and contrast in a wide range of print and display scenarios.
- New interface and user experience.

The wake up call for 3D was the explosion of lightweight 3D tools in the first few years of the last decade. The evolution of lightweight 3D products has led to the evolution of 3D in Photoshop. Photoshop 3D was optimized to use the same GPU APIs used by Photoshop such as OpenGL and OpenGL ES, leveraging the same fast native APIs for its rendering and compositing. Photoshop's 3D was not meant to host large amounts of native content, and, like 3D on the web, the use of the GPU-accelerated compositing and rendering infrastructure of Photoshop was merely an engine — taking the work that was traditionally done in a plug-in and putting it inside of Photoshop. The path forward for Photoshop is to leverage the native API on the GPU — developed over the last decade for native 2D apps like Photoshop, as well as the superset APIs of desktop, mobile, and embedded devices. Adobe's new 3D products are designed to be more like web-based 3D tools, using the same browser as a 3D environment and the native API to access it. Adobe's new native APIs will enable a rich ecosystem of tools to access Photoshop content directly on your GPU-accelerated device. What's more, this allows each of those tools to get to two components of the modern experience: 2D and 3D. The new native APIs allows Photoshop content to be easily shared and continued across desktop and mobile, and it provides a consistent place for the creation of 2D

and 3D graphics within Adobe's suite of products. The ultimate result is that users can create, edit, and use sophisticated graphics on their devices without having to use the most powerful desktop graphics application — supporting all modern devices. Use of the native APIs also allows developers to create amazing creative experiences using Photoshop content.
