Keymacro can be used to change how the mouse is "seen" by your computer. Usually, your computer treats the mouse pointer as a unique object with a unique coordinate. It means, that you can't send a message to the system, by just "pressing" a key. If your program can't get the "real" position of the mouse, then it can't do something. I wanted a method to change the mouse "coordinate" without a separate window, which also is running. In other words, the program should be able to work without any mouse pointer at all. So I used the messages "WM\_MOUSEMOVE" and "WM\_MOUSELEAVE". To be precise, I used the WM\_KEY macro. The Mouse movement can be changed in a simple ratio, so you don't have to calculate. By changing the numbers for the macros in the Keymacro tab, the movement will be changed. This is possible because of the different input messages, depending on where the mouse pointer is: Keymacro uses WM\_KEY message (directly to the system) in WM\_MOUSELEAVE message. So the ratio can be written as:  $a = \text{Mouse}_x * m$

## What's New In 1-4a Ratio Calculator?

You can add videos to your site using YouTube, Vimeo and Dailymotion and you want to know how big the videos should be in order to fit your site layout? You want to know which is the best quality to use? Or maybe you want to know how many images you can show per second in a 360° rotation? To be able to do all of this you will need some numbers. Well, if you have a browser window with the dimensions 900x900 pixels then you can just copy and paste some numbers from the internet. But wait a second, how can you be sure that the numbers are correct? Well, the new Ratio Calculator is the answer to your question. Differences to the other Ratio calculators out there: - This software calculates the optimal video area as percent compared to the browser window and will show the optimal video quality, so you don't have to guess. - It does not use pixels, but will show the results as percentages. - You can easily calculate both the width and height of the video to be sure that your chosen width/height ratio is optimal. - You can also calculate the image quality and the chosen width/height ratio in 360°. - You can easily make a list of all the videos in your site and show their exact width and height, so you can check that your site layout is optimized for the videos you use. - You can calculate the optimal image quality for different widths. Images & icons are available in various formats, including SVG, PNG, BMP, GIF and JPG. Icons are given as SVG format for using them in web sites, because they are scalable vector images that display very well. There are other formats available for specific uses. System Requirements: The supported browsers include Chrome, Firefox, Opera, Safari, IE10+ and Android 4.4+. Why are there so many files? For your free trial version you can see all files and get a free trial. But for the full version there are no files included. How to get a trial version of the software: Download the trial version (with limited functionality). Run the installed trial version. Make sure that you can see the buttons in the upper right corner. Click on one of the buttons and click on the 'Proceed'. The full version is then downloaded. How to get a license of the software: Download the software Check the license details on the website and accept it. Download the software again and click on the 'Proceed'. You can use the software for 1 year (30 days). License: The software is released under the GNU GPL v3. Additional License Info: The software is also released under the GNU Public License. For your information. I just got this in the mail. Ben -----
