Photoshop now includes UI and UX enhancements that make it easier to edit images in a browser, including a full-screen view mode, new control panel and context sensitive editing menu. Users can also use a one-click Delete and Fill tool to remove and replace object in a single action. In addition, Photoshop now supports multithreading and GPU compositing in its rendering engine. These tools enhance Photoshop's powerful editing and prep capabilities while also providing new ways to navigate, work and create images quickly. The desktop editions of Photoshop also gain new pallet color management features which provide access to accurate color in all photo editing processes. The new approach, among other things, allows users to apply corrections directly to the colors in their images, even if they are locked down. Adobe also added new key benefits to the Pantone Color Type library, which allows users to access accurate performances for a large range of materials. These new capabilities are part of Adobe's broader commitment to delivering innovative solutions to connectivity, media, marketing and creative industries. In other new features, Photoshop also features a redesigned range of Adobe Sensei-powered capabilities. This intelligence engine is able to extract information out of photos to quickly and accurately perform tasks such as detecting faces, removing objects from images, converting colors and more. In addition, Photoshop now includes a new feature called Selective Color, which can randomly sample colors in a photo to provide a high-quality color palette for fine-tuning mid contrast, saturation, hue and more. The new Selective Color feature is easily validated by using the new improvements to the Quick Selection tool. Photoshop also now allows a user to lock items on a layer (Drag a thumbnail to the Layers panel), access color profiles directly from the top menus and easily create layers from multiple images, among other things. The "palettes" group various items for most specific purposes.
