The breathtaking imagery of the likes of is now the stuff of blog posts. But do photographers really need to spend hours to get even the most basic shots looking professional. I found **Photoforge** to be quite useful, as I was able to use it to quickly and easily correct shadows, darken and refine colors in a photo I uploaded to the cloud. Other photo-editing apps like AgenPaint should step up their game in the future. Because most people end up using >10% of their incredibly expensive Photoshop tools, the rest of the product is simply a giant pile of useless, unneeded, and unmaintainable code. There are many times in Photoshop when it becomes clear that it was never designed with "people who use Photoshop" in mind. The most established reason for such a large collection of tools is that they can be re-purposed for other uses, but those other uses are usually reduced to creating spit-up-able web 2.0 applications of the same image processing algorithms. Consequently, it is nearly impossible to reuse any of **Photoshop's** own tools and one-off scripts and plug-ins because most of them are not maintained. Another problem with **Photoshop** is the long installation time for each new version. Although Adobe patches the paint well, the hoops **Photoshop** has to jump through again and again to get more features seems endless. The installation and loading times are unacceptable and if **Photoshop** would start using **Photoshop** itself to compile **Photoshop** once it's installed, it could easily cut the times substantially. Especially if **Photoshop** was to backup itself first and sync the updates every time.
