With Lightroom, it's easy to use manual adjustments, not just automatically applied monotone sliders or presets. You can adjust the levels and white balance of an image to bring out its best characteristics, or use the Canvas feature to draw your own custom adjustments. And since the adjustment layers are readily identifiable, they're easy to delete or adjust, depending on what you need. Lightroom 6 is a feature-packed app, and some people may take a minute to learn all of its capabilities. But in the end, it's all about the editing tools that matter most: the features that can help you take photos or transforms them into something special. I can't say I've ever had a firmware update on my Canon but on this one, it is undoubtedly a worth replacement. On my L-series lens, I could notice an improvement in terms of tracking and AF speed. Lightroom 5 also offers a new feature, Smart Preview, which detects that you are combining a RAW file with another camera format, and opens this other file in Lightroom, in addition to automatically opening the RAW file in Photoshop, addressing the problem you face when there is no RAW file. Lightroom 5 was finally able to recognize the use of an "x-NEF" file. Besides that, I can't pick up any performance speed gains. The performance impact is likely greater with the added RAM requirements. The small RAW2JPG conversion is moderately slower than the previous conversion. I tried to use the small RAW2JPG conversion when I decided to photograph different objects with the 20 MP-XTi lens. For some inexplicable reason, I could not 'split' the original RAW files into two files, making the lower resolution available with my 20 MP-XTi could not be used because it was too expensive in terms of processing power to edit the full resolution. Perhaps Adobe can find a smarter way to force the 'extended' file format in this regard.
