Making 3D versions of objects is now becoming easier with the emergence of 3D printable filament. This allows for anyone to print objects in any materials that they like, all without using any type of 3D printer whatsoever. This is because 3D printable filament can be used to produce the 3D models and can be created in a variety of materials. For instance, the newly-available Biofab filament could be used to create an artificial material for human skin. With his new discovery, we may soon see 3D printers before we even realize what is happening. By lowering the bar for what prints are, we may find that 3D printing could be the next big thing in technology. This could not be more evident if one can look at the development of the world of 3D printing today. Expansive printers like the Stereolithography that can span four cubic meters are now the standard in 3D printing. Even the most high-end of the 3D printers can be found with these types of printers for some time. If the 3D printer industry is going to continue to grow as it does, we can safely say that there will soon be 3D printers everywhere. And this may not be that far off from what is happening today with 3D prints. But if this is true, it is going to make a big impact.
