- **Three.js and WebGL:** WebGL APIs have been used to deliver some of the first features that showcase the power of 3D API integration in Photoshop. These new features include:

With these updates, Photoshop is taking a turn --a well-deserved one that marks 10 years of the legendary 35-millimeter film camera, and the 20th year of digital post-production technology. While these milestone achievements show the depth and breadth of Photoshop technology's innovation, the updates are also a strategic reminder of how Photoshop represents the future of post-production workflow. In a few years, we expect to see these features released to other Adobe apps, as well, so we're thrilled to finally share them there today. As part of the withdrawal of Photoshop from the rendering API, the new update adds an entirely new set of native APIs to enhance existing features, making them easier to use and more powerful. New GPU-accelerated features, such as GPU-powered intermediary layers, also make for more advanced use cases. With these new native APIs, Photoshop is better positioned to enhance its tools to meet all editing needs, to effortlessly generate new tools, and to accommodate the next stage of post-production workflow. This transition from a standard, CPU-intensive API to a graphics-optimized API is not happening all at once. These new APIs and features will be gradually introduced over the coming months, with more to come.
