As deep transform and retouching become more important tools in the creation of digital photos and videos, the need to edit them in software that is fast and reliable becomes just as important as the software itself. If you're looking to edit the kinds of images that you forward to clients, you'll want a product that will make your life easier, as well as one that can consistently deliver good results. We looked at the most popular products for photo editing, and rated them according to the following criteria.

The most common problem with blur is camera shake. If you have a very steady hand, this may not be a problem. However, if you're fiddling with the settings on your camera, or if you move the camera, either accidentally or purposefully, this can cause blurry images. With Lightroom, there are a couple of options that can help you control blur, as shown above.

When you are using autofocus on a camera, it can sometimes be a challenge to keep the subject in focus. This is often due to the camera needing to set the focus, then having a lack of skill to accurately judge where the subject is in the frame. Lightroom can help you control this. You can use its \"focus assist\" feature to help you. This works by showing you where the focus is most likely to be, and you can set the focus manually to achieve it.

Gamma is a way of adjusting the way a photo is displayed on a screen or on paper. Most cameras allow you to adjust this, and many people do so with a preference for a more \"natural\" look. This is usually a good thing if you are using your camera to capture a scene

with a lot of contrast from bright to dark areas, for example. This allows the color differences to be more noticeable to a viewer. Many photo editing programs allow you to adjust gamma, and Lightroom is no exception. You can adjust it to see how it affects the look of the image. You can also simply take a photo outside in direct sunlight where you can see that the inverse-gamma look might be preferred.
