Shaadi Mein Zaroor Aana (2017) Full Movie Free Download Hindi Dubbed HD.Q: Designing a switch/case statement for parsing rules in a language Are there any design rules on designing switch/case statements for parsing rules in a language? I mean let's say I want to write a language with a rule parsing engine. But the rules are highly structured and might look something like this: S -> I S T I ->... (parsing error) T -> ID STRING STRING -> '0'..'9'* ID -> { X: '0'..'9' 'A'..'Z' 'a'..'z' } X -> DIGIT You can basically see that the possible case statements are very complex and have nesting requirements. But there seems to be no design pattern for this. I usually develop using go and am wondering if there's any best practices for this? A: Designing a rule parsing engine seems like a project that would fit well in the domain of parser generator. But you can do it without using such a framework too. The general design principles are usually the same: Use state machines to model the structure of the language. Use context-free grammars to define the syntax of the language. Use recursive-descent parsers to turn the CFG into a parser. The only problem is that it's a hard task, and you usually spend a lot of time optimizing it to reach reasonable performances in the generated code. You'll have to decide if this is acceptable for your project. But there are often ways to make it faster, and there are solutions that fit perfectly well to your particular use cases. It's one of the few use cases where you can benefit from having a maintainable programming language. In your particular case: You can model the structure of the language using a state machine. It's actually quite simple: S -> I S
